Wildfire Smoke

- Wildfire smoke model (BlueSky Canada) currently estimates PM_{2.5} of 0.3 µg/m³ over Edmonton — good air quality from smoke alone.
- Nearest active fire detection (NASA FIRMS – VIIRS) is 9.1 km E of Edmonton, detected 2026-09-08 932 UTC.
- 6 additional active fire detection cluster(s) within 300 km of Edmonton.
- 2 active fire detections are to the NW of Edmonton. Surface winds are currently 10 km/h from the W, moving toward the E.
- This is roughly aligned with the fires to the NW, so smoke transport toward Edmonton from that direction is plausible based on surface winds.
- Forecast winds over the next 6 hours remain predominantly from the W, similar to current conditions.

Edmonton AQHI Map

- The shaded grid is an interpolated AQHI estimate across the region, not just the point readings at individual monitoring stations.
- It blends airshed-operated stations with community PurpleAir sensors, giving denser spatial coverage than stations alone provide, particularly between monitors.
