Wildfire Smoke

- Wildfire smoke model (BlueSky Canada) currently estimates PM_{2.5} of 0.4 µg/m³ over Edmonton — good air quality from smoke alone.
- Nearest active fire detection (NASA FIRMS – VIIRS) is 41.5 km NE of Edmonton, detected 2026-09-28 1947 UTC.
- 1 active fire detection is to the NE of Edmonton. Surface winds are currently 11 km/h from the W, moving toward the E.
- Current surface winds are not aligned with transport from the NE, so smoke reaching Edmonton from these fires is less likely right now based on surface winds alone.
- Forecast winds over the next 6 hours remain predominantly from the W, similar to current conditions.

Edmonton AQHI Map

- The shaded grid is an interpolated AQHI estimate across the region, not just the point readings at individual monitoring stations.
- It blends airshed-operated stations with community PurpleAir sensors, giving denser spatial coverage than stations alone provide, particularly between monitors.
