Wildfire Smoke

- Wildfire smoke model (BlueSky Canada) currently estimates PM_{2.5} of 1.3 µg/m³ over Edmonton — good air quality from smoke alone.
- Nearest active fire detection (NASA FIRMS – VIIRS) is 76.7 km NW of Edmonton, detected 2026-09-07 2121 UTC.
- 1 active fire detection is to the NW of Edmonton. Surface winds are currently 14 km/h from the N, moving toward the S.
- This is roughly aligned with the fires to the NW, so smoke transport toward Edmonton from that direction is plausible based on surface winds.
- Forecast winds over the next 6 hours remain predominantly from the N, similar to current conditions.

Edmonton AQHI Map

- The shaded grid is an interpolated AQHI estimate across the region, not just the point readings at individual monitoring stations.
- It blends airshed-operated stations with community PurpleAir sensors, giving denser spatial coverage than stations alone provide, particularly between monitors.
